

OTTO Introduces Source Separation Simplicity

**Easy, effective and economical that's the OTTO System
for source separation of recyclable and non-combustible materials.**

Need to separate recyclables?

OTTO makes it simple and economical with three cart sizes—32, 64 and 95 gallon capacity and seven color selections—grey, green, brown, blue, orange, red and yellow. You can choose the cart color, size and collection frequency best suited to your resource recovery program. Most importantly, you don't have to buy new special purpose trucks or equipment, your existing trucks can double as resource recovery collectors.

Need to separate non-combustibles?

OTTO makes it effective with color coded carts located at the source, the back door of the home, to insure citizen participation. This is essential where new waste to energy plants depend on a resource recovery program that will also divert non-combustibles.

Need qualified advice?

Because they have years of experience, Europeans lead the world in resource recovery with thousands of successful programs in place. Experience has shown that community collection centers do not work. More and more of these systems use OTTO carts to separate recyclables at the source, the home.

Making it simple and making it attractive with OTTO color coded carts you can insure citizen participation and simplify collection crew routines.

OTTO Source Separation Simplicity is simply state of the art.
